DYNALITE FRONT BRAKE KIT WITH 11.00" DIAMETER VENTED ROTOR

BASE PART NUMBER

140-11491

**DISC BRAKES SHOULD ONLY BE INSTALLED BY SOMEONE
EXPERIENCED AND COMPETENT IN THE INSTALLATION AND
MAINTENANCE OF DISC BRAKES
READ ALL WARNINGS**

WARNING

IT IS THE RESPONSIBILITY OF THE PERSON INSTALLING ANY BRAKE COMPONENT OR KIT TO DETERMINE THE SUITABILITY OF THE COMPONENT OR KIT FOR THAT PARTICULAR APPLICATION. IF YOU ARE NOT SURE HOW TO SAFELY USE THIS BRAKE COMPONENT OR KIT, YOU SHOULD NOT INSTALL OR USE IT. DO NOT ASSUME ANYTHING. IMPROPERLY INSTALLED OR MAINTAINED BRAKES ARE DANGEROUS. IF YOU ARE NOT SURE, GET HELP OR RETURN THE PRODUCT. YOU MAY OBTAIN ADDITIONAL INFORMATION AND TECHNICAL SUPPORT BY CALLING WILWOOD AT (805) 388-1188, OR VISIT OUR WEB SITE AT WWW.WILWOOD.COM. USE OF WILWOOD TECHNICAL SUPPORT DOES NOT GUARANTEE PROPER INSTALLATION. **YOU**, OR THE PERSON WHO DOES THE INSTALLATION MUST KNOW HOW TO PROPERLY USE THIS PRODUCT. IT IS NOT POSSIBLE OVER THE PHONE TO UNDERSTAND OR FORESEE ALL THE ISSUES THAT MIGHT ARISE IN YOUR INSTALLATION.

RACING EQUIPMENT AND BRAKES MUST BE MAINTAINED AND SHOULD BE CHECKED REGULARLY FOR FATIGUE, DAMAGE, AND WEAR.

Need Additional Information? Use Your
SmartPhone and Jump to Our Technical
Tips Section on Our Web Site.

DISC BRAKES
wilwood

WARNING

DO NOT OPERATE ANY VEHICLE ON UNTESTED BRAKES!
SEE MINIMUM TEST PROCEDURE WITHIN

ALWAYS UTILIZE SAFETY RESTRAINT SYSTEMS AND ALL OTHER AVAILABLE SAFETY EQUIPMENT WHILE OPERATING THE VEHICLE

IMPORTANT • READ THE DISCLAIMER OF WARRANTY INCLUDED IN THE KIT

NOTE: Some cleaners may stain or remove the finish on brake system components. Test the cleaner on a hidden portion of the component before general use.

Important Notice - Read This First

Before any tear-down or disassembly begins, review the following information:

- Some minor modifications may be required to the OEM spindle to clear the bracket assembly in the new kit. Refer to Figure 3, page 4.
- Review the Wheel Clearance Diagram (Figure 2, page 3) to verify that there is adequate clearance with the wheels you will be using with the installation.
- This brake kit does not include flex lines. OEM brake lines will not adapt to Wilwood calipers. Check the assembly instructions, or associated components section for brake line recommendations before assembly. In addition, Wilwood offers an extensive listing of brake lines and fittings on our web site: www.wilwood.com.
- Due to OEM production differences and other variations from vehicle to vehicle, the fastener hardware and other components in this kit may not be suitable for a specific application or vehicle.
- It is the responsibility of the purchaser and installer of this kit to verify suitability / fitment of all components and ensure all fasteners and hardware achieve complete and proper engagement. Improper or inadequate engagement can lead to component failure.

Photographic Tip

Important and highly recommended: Take photos of brake system before disassembly and during the disassembly process. In the event, trouble-shooting photos can be life savers. Many vehicles have undocumented variations, photos will make it much simpler for Wilwood to assist you if you have a problem.

Exploded Assembly Diagram

Figure 1. Typical Installation Configuration

Parts List

ITEM NO.	PART NO.	DESCRIPTION	QTY
1	249-11492/93	Bracket Kit, Caliper Mounting (pair, one each, right and left)	1
2	230-10426	Bolt, 7/16-20 x 2.50" Long, Hex Head	4
3	240-11101	Washer, .453" I.D. x .750" O.D. x .063" Thick	8
4	230-9182	Nut, Lock 7/16-20, 12 Point	4
5	230-10421	Bolt, 5/8-18 x 1.12" Long, Flat Head	2
6	230-2187	Stud, Wheel, 1/2-20 x 1.75" Long, 12 Point	10
7	270-11032	Hub Assembly	2
8	370-0879	Cone, Inner Bearing	2
9	380-0928	Seal, Grease	2
10	300-3307	Adapter, Rotor	2
11	160-5840	Rotor, .81" Thk x 11.00" Dia, 6 x 6.25" Bolt Circle	2
11A	160-7099/00-BK	Rotor, Drilled and Slotted (pair, one each, right and left)	2
12	230-11934	Bolt, 5/16-18 x 0.75" Long, Torx Button Head	12
13	230-11239	Bolt, 3/8-16 x 1.00" Long, Torx Button Head	10
14	370-0877	Cone, Outer Bearing	2
15	240-2283	Washer, Spindle, 3/4"	2
16	211-1674	O-ring	2
17	270-2158	Cap, Dust	2
18	120-13844-BK	Caliper, Forged Dynalite	2
18A	120-13844-RD	Caliper, Forged Dynalite, Red	2
19	240-1159	Shim, .035 Thick	16
20	240-10190	Washer, .391" I.D. x .625" O.D. x .063" Thick	4
21	230-10025	Bolt, 3/8-24 x 1.25" Long, Hex Head	4
22	150-8850K	Pad, BP-10, Axle Set	1
23	180-0055S	Pin, Cotter	2
24	300-11961	Spacer, Wheel, .20" Thick	2
25	240-9074	Shim, .024" Thick (for CPP spindles only)	6

NOTES: Part Number 230-15369 Bolt Kit, wheel studs, includes part number 230-2187

Part Number 230-11052 Bolt Kit, bracket bolt kit, includes p/n's 230-9182, 230-10421, 230-10426, 240-9074 and 240-11101

Part Number 230-3829 Bolt Kit, adapter plate to hub, includes part number 230-11239

Part Number 230-12121 Bolt Kit, rotor to adapter plate, includes part number 230-11934

Part Number 230-11861 Bolt Kit, caliper to bracket, includes part numbers 230-10025, 240-10190 and 240-1159

Item 11A is an optional item and is available in the (D) drilled kits. Add "-D" to end of part number when ordering.

Item 18A is an optional item and is available in the (R) red caliper kits. Add "-R" to end of part number when ordering.

General Information

Installation of this kit should **ONLY** be performed by persons experienced in the installation and proper operation of disc brake systems. Before assembling the Wilwood disc brake kit, double check the following items to ensure a trouble-free installation.

- Make sure this is the correct kit to match the exact make and model year of the vehicles spindle (i.e., hubs for a 1955 Chevrolet spindle will not fit a 1966 spindle).
- Verify wheel clearance utilizing Figure 2.
- Inspect the package contents against the parts list to ensure that all components and hardware are included.
- Verify the new hub stud pattern in this kit matches the lug pattern of the vehicles wheels.
- WARNING:** The wheel contact surfaces must seat completely on the face of the hub. If any contact surfaces overhang the outside diameter of the hub face, a 6.60" diameter x .20" thick steel spacer (item 24, Wilwood P/N 300-11961) MUST be used between the wheel and the hub.

Figure 2. Wheel Clearance Diagram

General Information (Continued), Disassembly and Assembly Instructions

- To prevent damage to the hub face, a 6.15" diameter x .09" thick hub shield (Wilwood P/N 300-10716) should be used with any *stamped steel wheels* that do NOT overhang the outside diameter of the hub face.
- Always tighten lug nuts to the wheel manufacturer's specifications.
- Always recheck the lug nuts after test driving the vehicle at safe speeds. If they are NOT still tight, inspect the wheel-to-hub contact surfaces for damage and/or incomplete contact.
- As routine maintenance, periodically remove the wheels and inspect the wheel-to-hub contact surfaces for damage.
- It is the installer's responsibility to ensure that the wheels used with this hub kit are properly and securely installed. Some wheels may NOT be compatible with the hub in this kit.

Disassembly Instructions

- Disassemble the original equipment front brakes:
Raise the front wheels off the ground and support the front suspension according to vehicle manufacturer's instructions.

Remove the front wheels and completely disassemble the stock brake system down to the bare spindles. Save the Original Equipment Manufacturer (OEM) spindle nuts and nut locks (if any).
- Remove any nicks or burrs on the spindle mount faces that may interfere with the installation of the new brake components.
- Clean and de-grease the spindles and saved components.

Figure 3. Spindle Modification

Modification:

- Using the new bracket assembly (1) as a template, if necessary, remove material from the mounting flange of the OEM spindle in the area shown in Figure 3. Remove only the minimum amount of material necessary to clear the new bracket.

Assembly Instructions

•**NOTE:** Numbers in parenthesis refer to the parts list on the preceding page and Figure 1.

•**CAUTION:** All mounting bolts must fully engage clinch nuts. Be sure to check that all bolts are either flush or protruding through flanged side of clinch nut after shimming, Figure 4.

•The caliper mounting bracket (1) has been assembled at the factory for alignment purposes. Loosen the two bolts that secure the brackets together so that the bolts are hand tight only, this will enable the bracket assembly to be adjusted to accommodate various spindle tolerances during assembly. Orient the bracket as shown in Photo 1 and Figure 1, and install to lower mount holes using bolts (2), washers (3), and lock nuts (4), Figure 1 and Photo 1. Do not tighten yet.

Photo 1

Photo 2

- For Classic Performance Products spindles only:** Initially use two .024" thick shims (25) on upper mount bolt between bracket and spindle, Figure 1. While test fitting bracket assembly per the instructions below, check that the bracket is parallel to the rotor. If not, add or subtract shims (25) between the bracket and spindle.
- Install bolt (5) in the upper bracket hole. Temporarily tighten all of the bracket mounting bolts. Ensure that the flanged heads of the clinch nuts in the bracket are facing outboard, Photo 1. **NOTE:** The bracket must fit squarely against the mounting points on the spindle. Inspect for interference from casting irregularities, machining ridges, burrs, etc. Torque lower lock nuts to 47 ft-lb. Remove the upper bolt, apply red *Loctite*® 271 to threads, and torque to 140 ft-lb. Remove one at a time the bolts that secure the bracket assembly to each other, apply red *Loctite*® 271 to the threads and torque to 40 ft-lb.

Assembly Instructions (Continued)

- Install wheel studs (6) into the hub (7), Photo 2. Torque to 77 ft-lb.

NOTE: There are two five lug patterns in the hub (5 x 4.50 and 5 x 4.75). Ensure the correct hub stud pattern is being used to fit the wheel application.

- Pack the large inner bearing cone (8) with high temperature disc brake bearing grease (available from your local auto parts store) and install into the backside of the hub (7), Photo 3.

- Install the grease seal (9) by pressing into the backside of the hub (7), flush with the end of the hub, Photo 3.

- Orient the rotor (11) and the rotor adapter (10) as shown in Figure 1 and Photo 4. Attach the rotor to the adapter using bolts (12). Using an alternating sequence, apply red *Loctite*® 271 to the threads, and torque to 25 ft-lb.

- Mount the adapter/rotor assembly (10/11) to the hub (7) using bolts (13), as shown in Figure 1 and Photo 5. Using an alternating sequence, apply red *Loctite*® 271 to the threads, and torque to 45 ft-lb.

- Pack the small outer bearing cone (14) with high temperature disc brake bearing grease and install into hub (7). Slide the hub/rotor assembly onto the spindle. Secure using spindle washer (15) and OEM spindle nut, Photo 6. Bearing adjustment: Tighten the nut while turning the hub. When there is a slight bind on the bearings, they are seated correctly. Back the nut off about 1/6 to 1/4 of a turn, or sufficiently to allow .001" to .007" end play. **WARNING:** Failure to back off adjusting nut could cause bearing to run hot and be damaged, which could cause the wheel to lock or come off. Install OEM spindle nut retainer and new cotter pin (not supplied).

- Screw dust cap (17) into hub (7), Photo 7. Friction created by the o-ring (16) on the dust cap keeps it from unscrewing. **NOTE:** The O.D. of the existing OEM spindle washer may be larger than the I.D. of the dust cap not allowing it to seat against the hub face. Therefore, use the spindle washer (15) supplied with the kit instead of the OEM washer.

- NOTE:** Please reference the caution statement at the beginning of the assembly instructions. Mount the caliper (18) onto the caliper mounting bracket (1) using bolts (21) and washers (20), as shown in Figure 1. Initially place two .035" thick shims (19) on each bolt between the caliper and the bracket, Photo 8. Temporarily tighten the mounting bolts and view the rotor (11) through the top opening of the caliper. The rotor should be centered in the caliper, Photo 9. If not, adjust by adding or subtracting shims between the bracket and the caliper. Always use the same amount of shims on each of the two mounting bolts. **NOTE:** The end of each bolt must be flush with or slightly

Photo 3

Photo 4

Photo 5

Figure 4. Clinch Nut Engagement Diagram

Photo 6

Photo 7

Photo 8

Assembly Instructions (Continued)

protruding from the head of the clinch nut, as shown in Figure 4. If necessary place spare shims between washer (20) and caliper mounting ear to achieve the proper clinch nut engagement. Once the caliper alignment and clinch nut engagement are correct, remove the bolts one at a time, apply red *Loctite*® 271 to bolt threads, and torque to 40 ft-lb.

Photo 9

Photo 10

- Install the disc brake pads (22) into the caliper, with the friction material facing the rotor (11), and secure in place using cotter pin (23), Photo 10.
- Temporarily install wheel and torque lug nuts to manufacturer's specification. Ensure that the wheel rotates freely without any interference. **NOTE:** Wheel spacer (24) MUST be used if any wheel contact surfaces overhang the outside diameter of the hub face. See warning on page 3.
- **NOTE:** OEM rubber brake hoses generally cannot be adapted to Wilwood calipers. The caliper inlet fitting is a 1/8-27 NPT. The preferred method is to use steel adapter fittings at the caliper, either straight, 45 or 90 degree (use PTFE tape on pipe threads of adapter fitting for proper sealing to caliper) and enough steel braided line to allow for full suspension travel and turning radius, lock to lock. Wilwood offers a brake flex line hose kit to fit this application, order P/N 220-7699. Hose kit includes hoses, fittings, etc., all in one package for this application. **Carefully route hoses to prevent contact with moving suspension, brake or wheel components.** **NOTE:** Wilwood hose kits are designed for use in many different vehicle applications and it is the installer's responsibility to properly route and ensure adequate clearance and retention for brake hose components.
- **NOTE:** Specified brake hose kits may not work with all Years, Makes and Models of vehicle that this brake kit is applicable to, due to possible OEM manufacturing changes during a production vehicle's life. It is the installer's responsibility to ensure that all fittings and hoses are the correct size and length, to ensure proper sealing and that they will not be subject to crimping, strain and abrasion from vibration or interference with suspension components, brake rotor or wheel.
- In absence of specific instructions for brake line routing, the installer must use his best professional judgment on correct routing and retention of lines to ensure safe operation. Test vehicle brake system per the '**Minimum Test Procedure**' stated within this document before driving. After road testing, inspect for leaks and interference. Initially after install and testing, perform frequent checks of the vehicle brake system and lines before driving, to confirm that there is no undue wear or interference not apparent from the initial test. Afterwards, perform periodic inspections for function, leaks and wear in a interval relative to the usage of vehicle.
- Bleed the brake system, referring to the '**Additional Information and Recommendations**' on page 7 for proper bleeding instructions. Check system for leaks after bleeding.
- Install the wheel and torque to manufacturer's specifications. **NOTE:** Wheel spacer (24) MUST be used if any wheel contact surfaces overhang the outside diameter of the hub face. See warning on page 3.
- Bed-in the brake pads per the procedure on page 8.

Balancing the Brake Bias on 4 Wheel Disc Vehicles

•OE Style or Single Mount Race Pedal with Tandem Outlet Master Cylinder:

Front to rear caliper piston sizes, rotor diameters, and pad compounds must be initially configured to provide the correct range of vehicle bias when using a single bore / tandem outlet master cylinder. If excessive rear brake bias is experienced, an inline adjustable proportioning valve can be used to decrease the rear line pressure to help bring the vehicle into balance. If excessive front brake bias is experienced, first consideration should be given to increasing the rear brake bias to bring the vehicle into overall balance.

•Race Pedal with Dual Master Cylinders and Balance Bar:

Master cylinders must be sized to match the calipers and allow the pedal balance bar to operate near the center of its travel. If it is not possible to fine tune the bias within the adjustable range of the balance bar, then consideration must be given to changing a master cylinder bore size or some other aspect of the brake system to bring the car into balance. Larger bore master cylinders will generate less pressure while decreasing pedal travel. Smaller bores master cylinders will generate higher line pressures with an increase in pedal travel.

Additional Information and Recommendations

•Fill and bleed the new system with Wilwood Hi-Temp° 570 grade fluid or higher. For severe braking or sustained high heat operation, use Wilwood EXP 600 Plus Racing Brake Fluid. Used fluid must be completely flushed from the system to prevent contamination. **NOTE:** *Silicone DOT 5 brake fluid is **NOT** recommended for racing or performance driving.*

•To properly bleed the brake system, begin with the caliper farthest from the master cylinder. Bleed the outboard bleed screw first, then the inboard. Repeat the procedure until all calipers in the system are bled, ending with the caliper closest to the master cylinder. **NOTE:** *When using a new master cylinder, it is important to bench bleed the master cylinder first.*

•If the master cylinder is mounted lower than the disc brake calipers, some fluid flowback to the master cylinder reservoir may occur, creating a vacuum effect that retracts the caliper pistons into the housing. This will cause the pedal to go to the floor on the first stroke until it has “pumped up” and moved all the pistons out against the pad again. A Wilwood in-line two pound residual pressure valve, installed near the master cylinder will stop the fluid flowback and keep the pedal firm and responsive.

•Test the brake pedal. It should be firm, not spongy and stop at least 1 inch from the floor under heavy load.

If the brake pedal is spongy, bleed the system again.

If the brake pedal is initially firm, but then sinks to the floor, check the system for fluid leaks. Correct the leaks (if applicable) and then bleed the system again.

If the brake pedal goes to the floor and continued bleeding of the system does not correct the problem, a master cylinder with increased capacity (larger bore diameter) will be required. Wilwood offers various lightweight master cylinders with large fluid displacement capacities.

•**NOTE:** *With the installation of after market disc brakes, the wheel track may change depending on the application. Check your wheel offset before final assembly.*

•On some models of disc brake spindles there are “ears” where the OEM calipers were mounted and these “ears” interfere with the assembly of the Wilwood disc brake kit. If it becomes necessary to remove these “ears”, remove as little as possible being careful not to cut away any of the mounting holes that may be required to bolt on the caliper mounting bracket.

•If after following the instructions, you still have difficulty in assembling or bleeding your Wilwood disc brakes, consult your local chassis builder, or retailer where the kit was purchased for further assistance.

Brake Testing

WARNING • DO NOT DRIVE ON UNTESTED BRAKES BRAKES MUST BE TESTED AFTER INSTALLATION OR MAINTENANCE MINIMUM TEST PROCEDURE

- Make sure pedal is firm: Hold firm pressure on pedal for several minutes, it should remain in position without sinking. If pedal sinks toward floor, check system for fluid leaks. DO NOT drive vehicle if pedal does not stay firm or can be pushed to the floor with normal pressure.
- At very low speed (2-5 mph) apply brakes hard several times while turning steering from full left to full right, repeat several times. Remove the wheels and check that components are not touching, rubbing, or leaking.
- Carefully examine all brake components, brake lines, and fittings for leaks and interference.
- Make sure there is no interference with wheels or suspension components.
- Drive vehicle at low speed (15-20 mph) making moderate and hard stops. Brakes should feel normal and positive. Again check for leaks and interference.
- Always test vehicle in a safe place where there is no danger to (or from) other people or vehicles.
- Always wear seat belts and make use of all safety equipment.

Pad and Rotor Bedding

BEDDING STEPS FOR NEW PADS AND ROTORS – ALL COMPOUNDS

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

- Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.
- After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.
- Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.
- If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.
- Drive at a moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

COMPETITION VEHICLES

- If your race car is equipped with brake cooling ducts, blocking them will allow the pads and rotors to warm up quicker and speed up the bedding process.
- Temperature indicating paint on the rotor and pad edges can provide valuable data regarding observed temperatures during the bedding process and subsequent on-track sessions. This information can be highly beneficial when evaluating pad compounds and cooling efficiencies.

Pad and Rotor Bedding (Continued)

POST-BEDDING INSPECTION – ALL VEHICLES

- After the bedding cycle, the rotors should exhibit a uniformly burnished finish across the entire contact face. Any surface irregularities that appear as smearing or splotching on the rotor faces can be an indication that the brakes were brought up to temperature too quickly during the bedding cycle. If the smear doesn't blend away after the next run-in cycle, or if chatter under braking results, sanding or resurfacing the rotors will be required to restore a uniform surface for pad contact.

PRE-RACE WARM UP

- Always make every effort to get heat into the brakes prior to each event. Use an on-and-off the pedal practice to warm the brakes during the trip to the staging zone, during parade laps before the flag drops, and every other opportunity in an effort to build heat in the pads and rotors. This will help to ensure best consistency, performance, and durability from your brakes.

DYNO BEDDED COMPETITION PADS AND ROTORS

- Getting track time for a proper pad and rotor bedding session can be difficult. Wilwood offers factory dyno-bedded pads and rotors on many of our popular competition pads and **Spec 37** GT series rotors. Dyno-bedded parts are ready to race on their first warm up cycle. This can save valuable time and effort when on-track time is either too valuable or not available at all, Dyno-bedding assures that your pads and rotors have been properly run-in and are ready to go. Contact your dealer or the factory for more information on Wilwood Dyno-Bedding services.

NOTE: NEVER allow the contact surfaces of the pads or rotors to be contaminated with brake fluid. Always use a catch bottle with a hose to prevent fluid spill during all brake bleeding procedures.
